

# Droplet and aerosol reducing tent

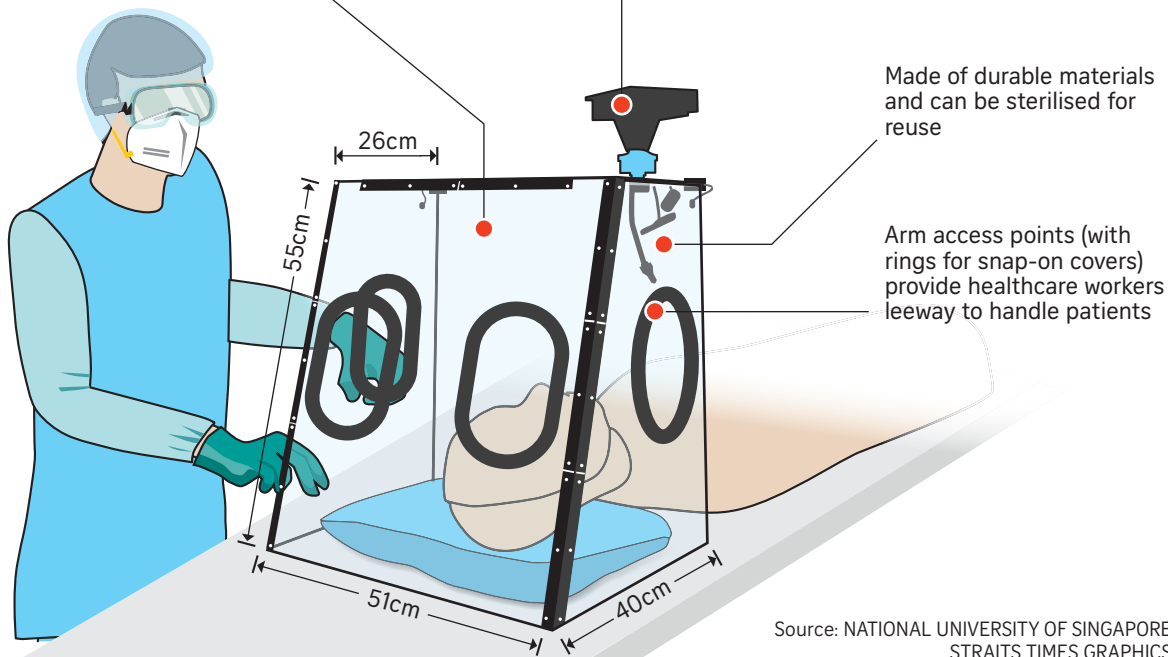

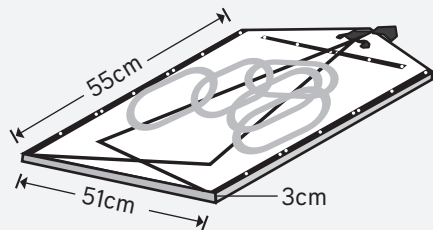

A team from the National University of Singapore and National University Hospital has developed a new device to provide additional protection for healthcare workers caring for Covid-19 patients.

## HOW IT WORKS

Can be placed around the patient's head when performing procedures such as intubation and extubation

Has a unique exhaust function with filter to reduce leakage of exhaled aerosols or droplets from the patient

**Foldable, easy to transport and store**

Made of durable materials and can be sterilised for reuse

Arm access points (with rings for snap-on covers) provide healthcare workers leeway to handle patients
