

# Key features of new medical facility

The Tengah Air Base medical centre, officially opened yesterday, incorporates pandemic-ready infrastructure and technological features. Improvements trialed could be implemented at other SAF medical centres in the future.

## DISPENSARY

The outward-facing design is meant to allow medication to be given to patients with acute respiratory infection symptoms without risk to other patients.

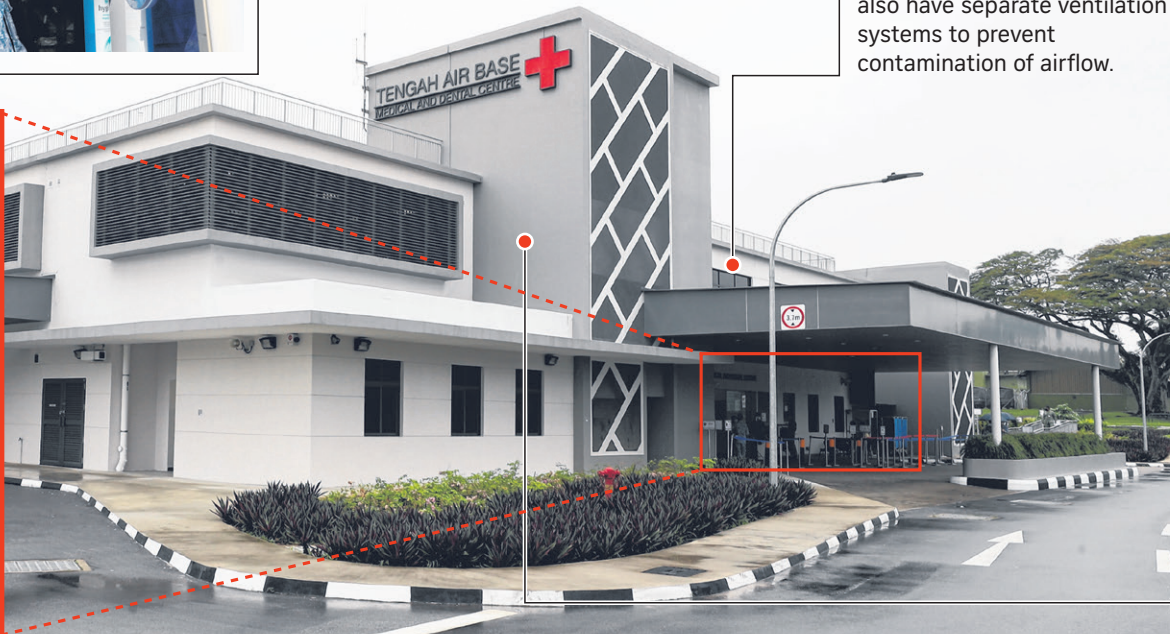

## SWABBING BOOTH

A booth outside the medical centre where servicemen can get swabbed to be tested for infectious diseases like Covid-19. This minimises contamination risks and reduces the use of personal protective equipment.

## ISOLATION ROOMS

This is one of the four isolation rooms at the medical centre, where suspected Covid-19 patients could stay in until the arrival of an ambulance to take them to hospital. The rooms also have separate ventilation systems to prevent contamination of airflow.

## SELF-SERVICE LOCKERS

The lockers allow servicemen to collect their medication at their convenience. This, along with telemedicine, would enable a contactless healthcare experience.
